

High-Resolution Follow-up of TESS candidate planets with 8m-class telescopes

Elisabeth Matthews, Ian Crossfield, David Ciardi, Steve Howell, Charles Beichman,
Erica Gonzalez, Rachel Matson, Joshua Schlieder

Many transit-like signals are not produced by planets

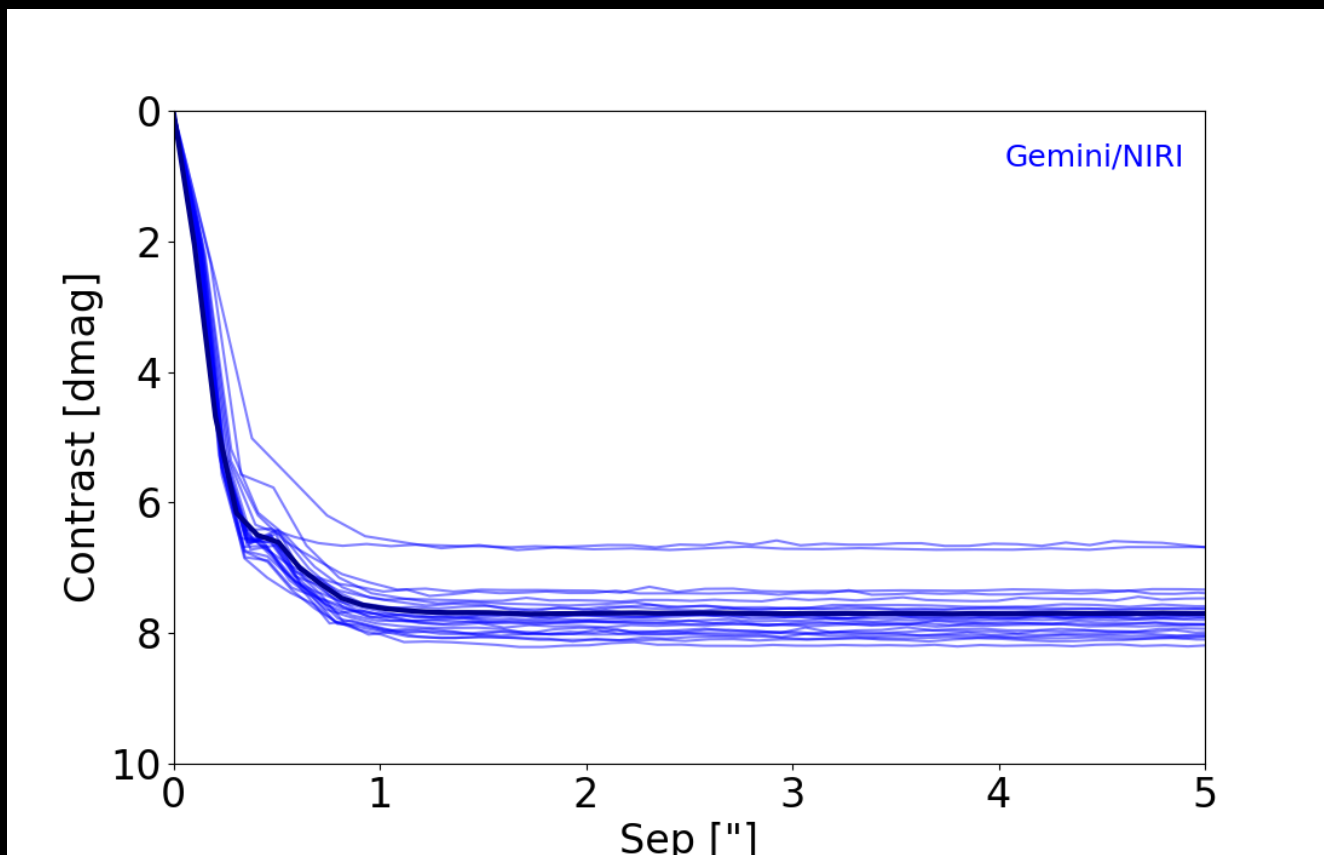

8m telescope time at MIT

- Gemini Large Program (PI Crossfield, 135 hours, 2018b-2020a): NIRI, DSSI, 'Alopeke
- VLT/NaCo P102 (PI Crossfield, 10 hours)
- VLT/NaCo P103 (PI Matthews, 20 hours)

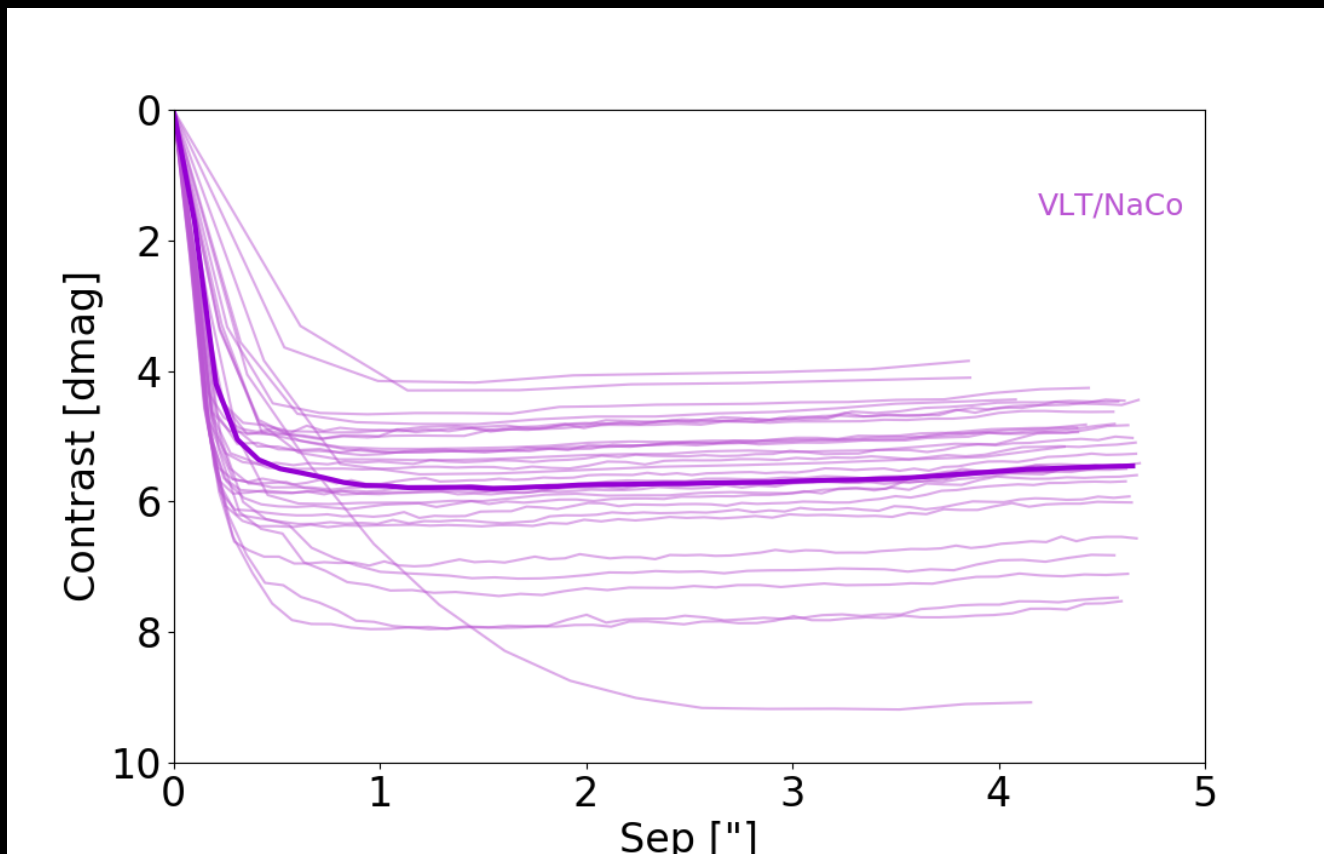

SG3 as a whole

- 986 total observations; 689 unique targets
- See posters 32 (Lund), 21 (Ziegler), 27 (Dressing)

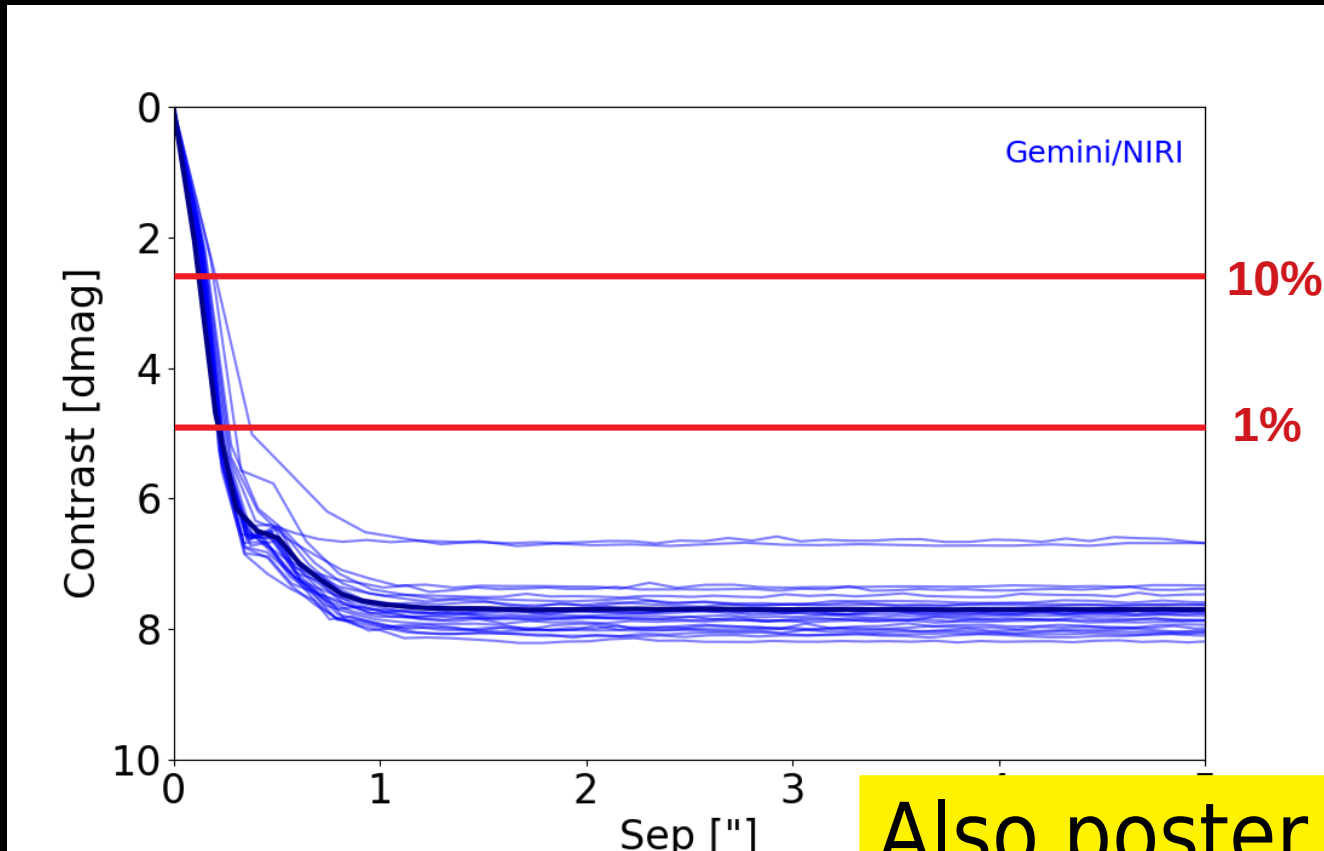

Performance with Gemini/NIRI

Performance with VLT/NaCo

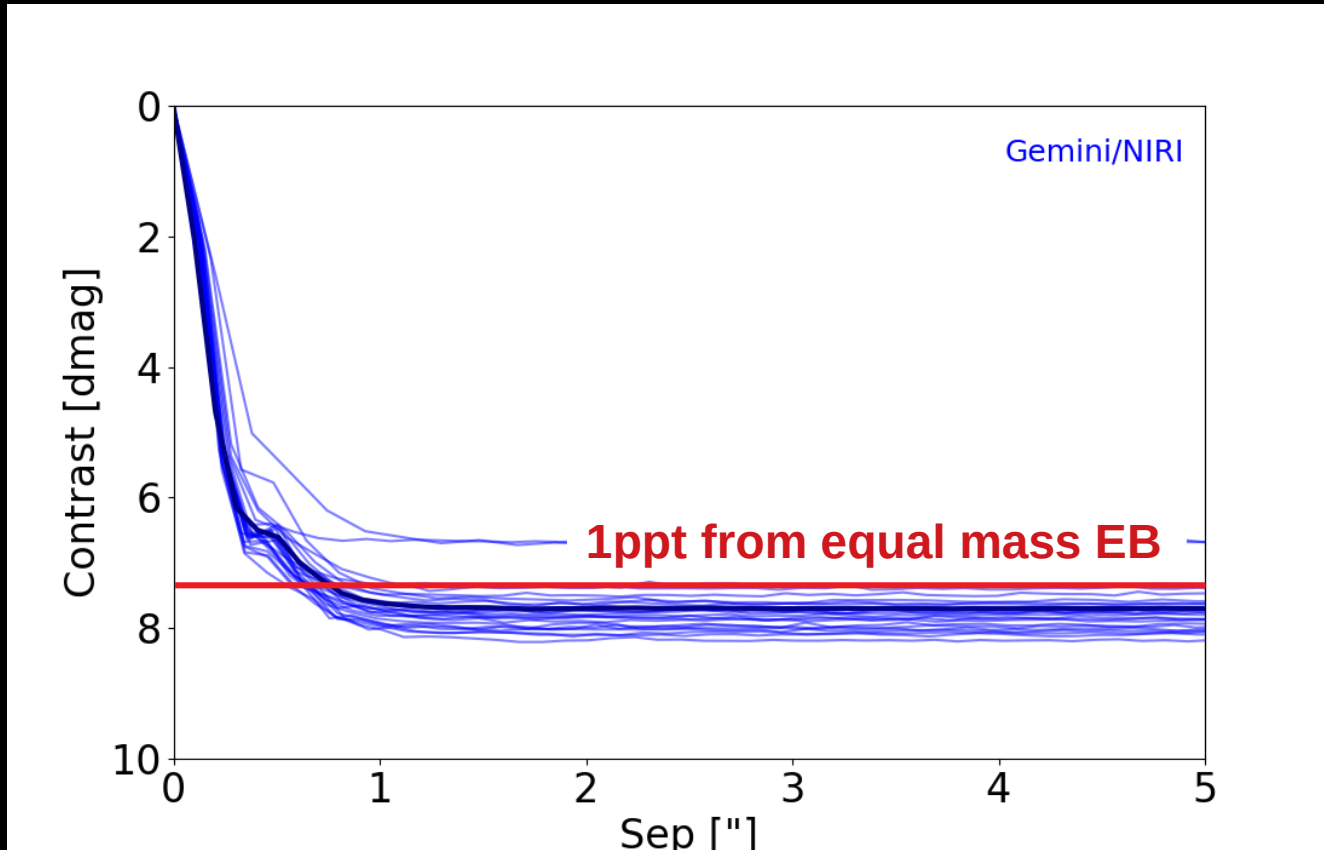

Measured radii are too small

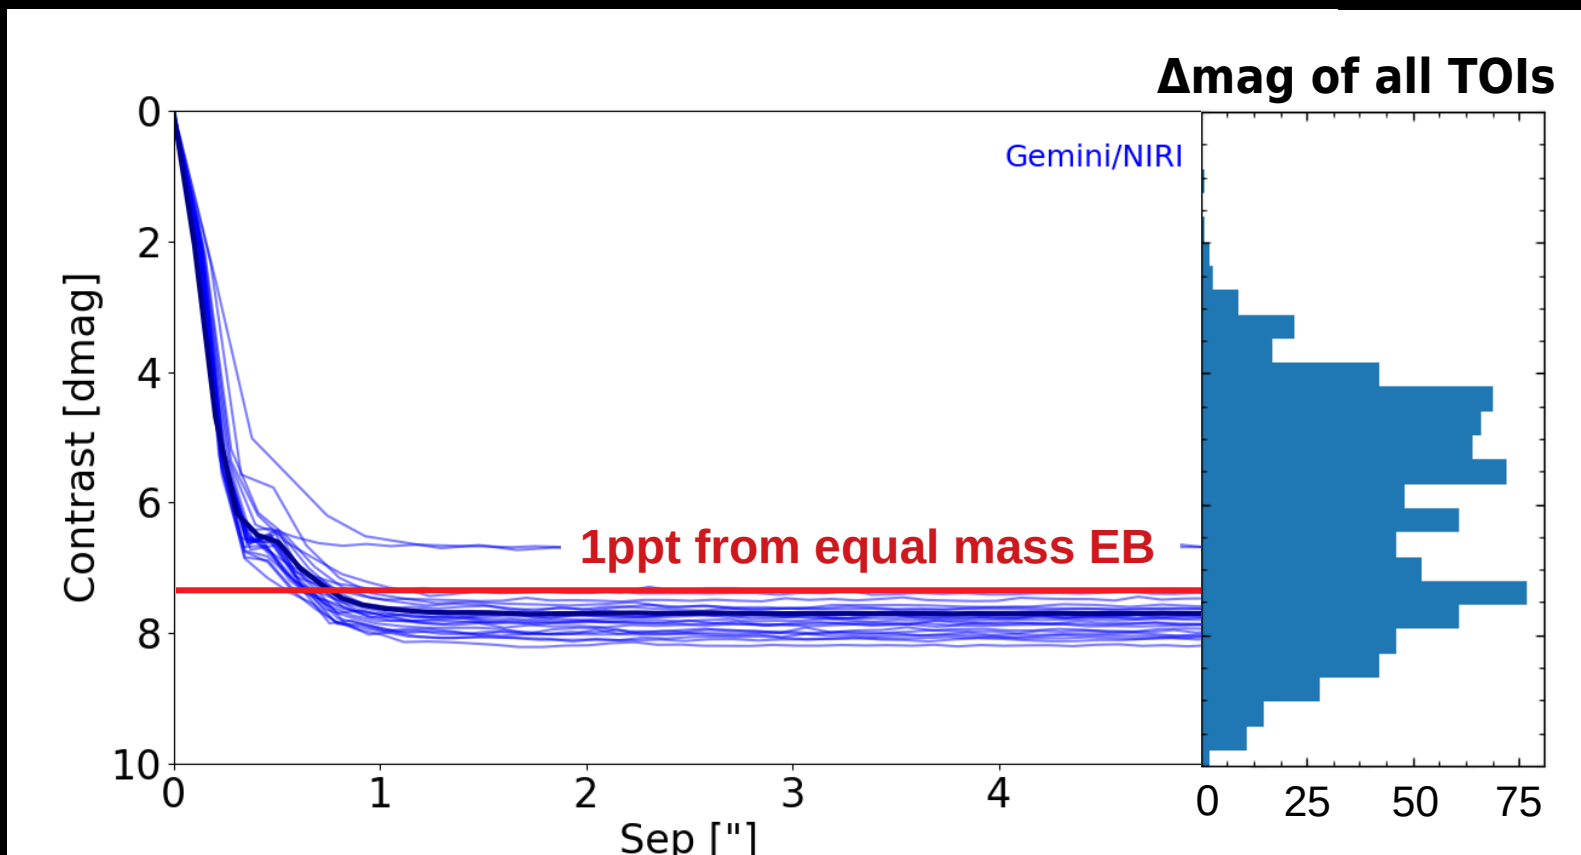

Also poster 32 (Lund)

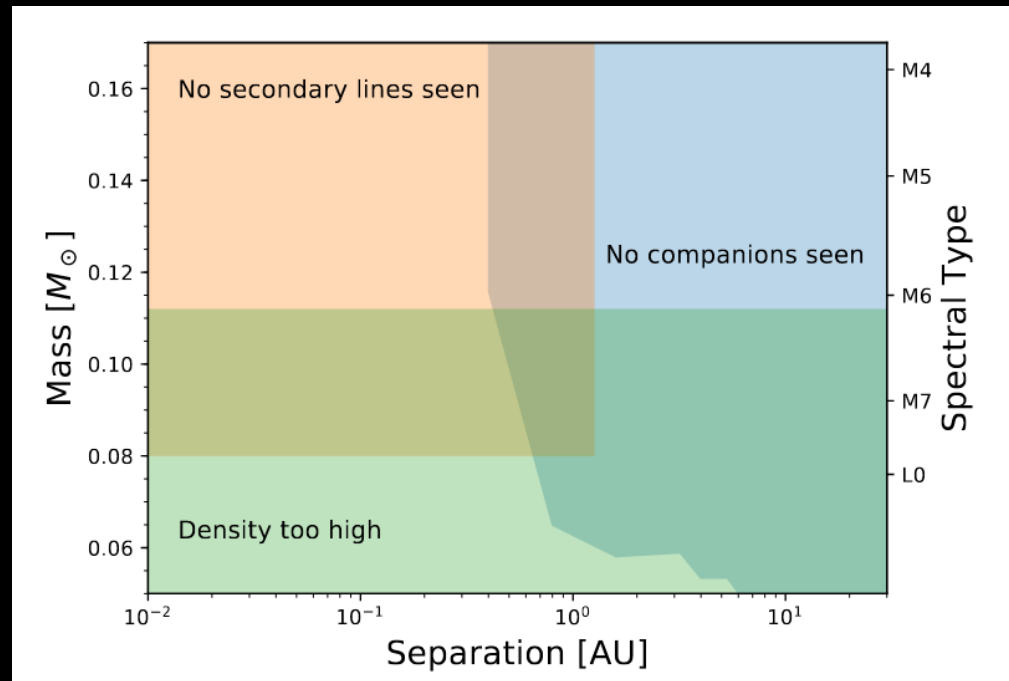

Some “planets” are really EBs

Some “planets” are really EBs

For nearby TOIs, we can rule out stellar companions at all separations

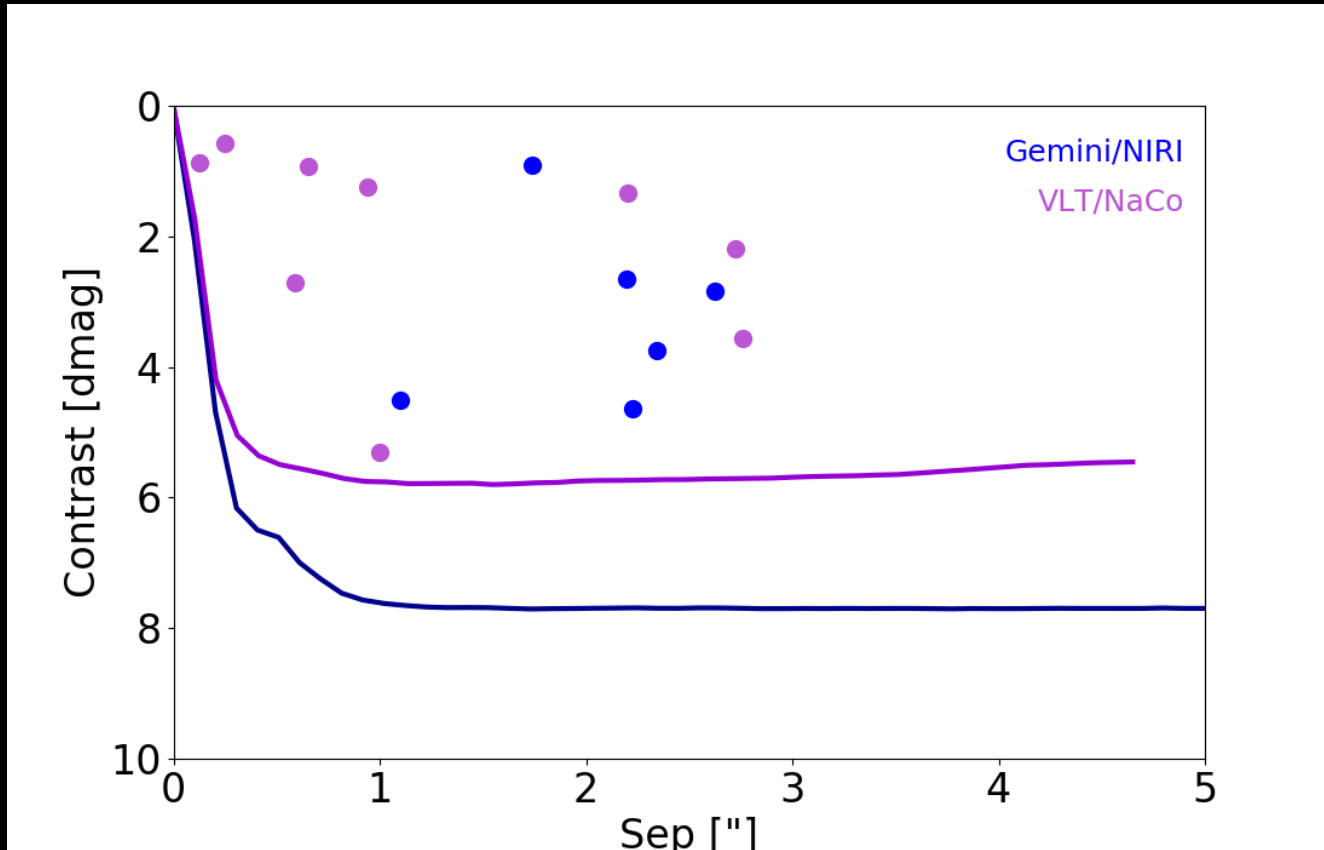

LP791-18, Crossfield et al. 2019

The Next Steps:

**Isochronal + Statistical
analysis of bound companions**

The Next Steps:

**Isochronal + Statistical
analysis of bound companions**

**Combine high resolution
images with recon spectra
and a complete GAIA search
for companions**

Also poster 21 (Ziegler)

Conclusions

- Gaia is a good first step
- High resolution imaging is essential for confirming planets, especially with small signals
- We have 70 TOIs imaged with 8m AO so far, with many more to come.
- Let us know any TOIs we should observe!
